Press a key to change the current sequence from {seq} to {seq+1}. Note: If you change the list to add new entries or remove entries, the keyboard can stop working for a few seconds. Press the control key to recover. Please note that on all platforms, when the system is not in the current sequence, the sequence number will always be 1. Keymacro Introduction: Keymacro is a simple macro utility that can be used to edit sequences of keystrokes. It provides a hot-key interface to the user to perform macro operations with many new features. Keymacro can be used to do many different things: ☐ Play music. ☐ Create shell scripts. ☐ Control common software, like web browsers, document managers, mail clients, games, etc. ☐ Play games. ☐ Run utilities. ☐ Create shortcuts. ☐ Do system and file recovery. ☐ Modify text files. Macro Performance: Keymacro offers a full featured hot-key interface to the user to perform complex operations with a minimum of keyboard interaction. Keymacro can run its operation in real time, or it can be scheduled to run at some time. The user can also keep track of when a macro is scheduled to run and cancel it any time. If you want to schedule a macro, you can use the user interface, the command-line interface

or even API-calls. Keymacro Keystrokes: The user interface of the macro utility has many components that make macro creation easier and faster. The user can create, edit and execute macros by using the keyboard or a mouse. Keymacro does not use the standard keyboard layout. It makes use of keyboard macros that are called "keys" to perform its operations. Most of the commands in Keymacro have a single "keys" that represents the command itself. For example, Ctrl+F1 to Open the File window, Ctrl+F5 to Open the Save dialog, Ctrl+F6 to Run the Save macro, Ctrl+F9 to Quit Keymacro, etc. However, the user can also use any other key to operate the macro. For example, you can press Ctrl+F1 with the left-hand-side-of-the-keyboard to Open the File window, or Ctrl+F6 with the right-hand-side 81e310abff
